

Axon

The supply chain management system

Axon is a fully integrated supply chain system for small to medium businesses who manufacture as a single body or as complete assembly.

Axon uses the latest cloud technology and only requires a web browser to operate. Axon can be fully integrated with the planning and scheduling system *Preactor* – which comes free when a user purchases Axon.*

*The standard monthly rental fee for Axon is **£200**.

Axon has several functionalities that are integral to many manufacturing businesses. Here are just a few;

- Quotations with auto costing
- Order book invoicing
- Complex Bill of Materials component
- Shop Floor Data Capture
- Material Ordering
- Stock Control

Axon is designed around the “made – to – order” concept, which will assign the job to one of three material requirements;

- 1) Finished Goods Stock
- 2) Work-in-Progress Stock
- 3) Purchase Parts

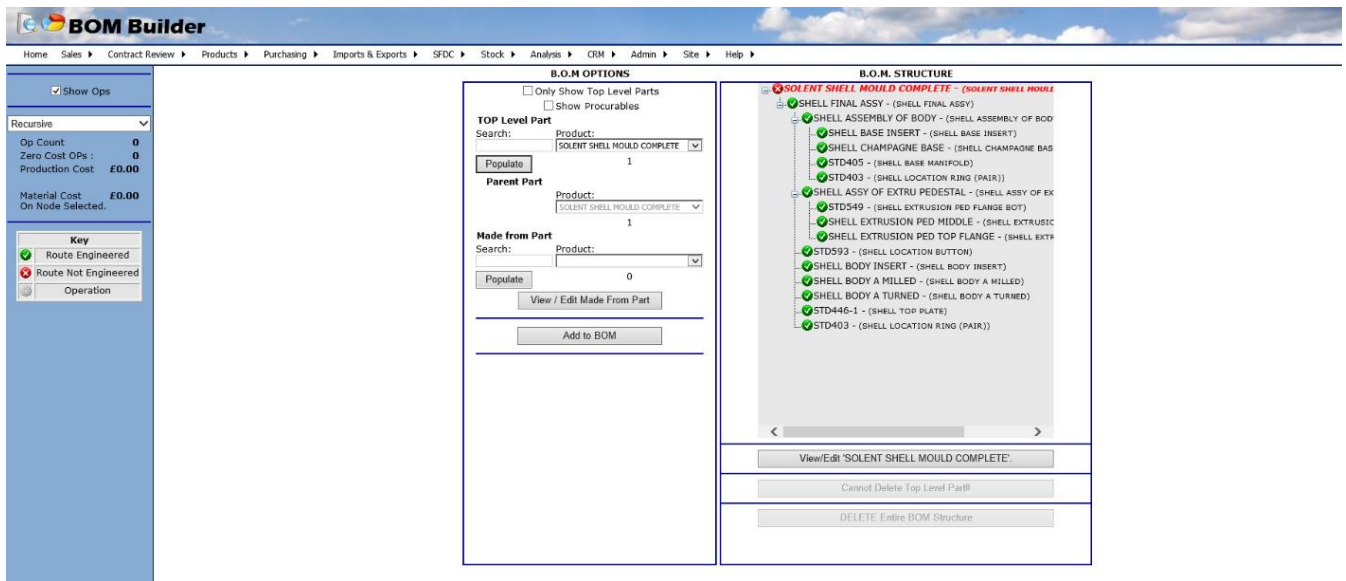

How is it different?

Axon is different to other quoting software because it has a direct link to shop floor data capture software.

How does it work?

Axon is a multi-user system which can organise quotes without the need for paper copies. A quote in Axon is simply passed to an order book and then to a contract review stage where the production control tests are administered. This simple and seamless process makes managing and delivering quotes easy and effective.

If required this order is passed with a link to planning and scheduling system, Preactor. Preactor system will generate a schedule and then pass this onto another complex system where a scheduling of structured "Bill of Materials" BOMs is required. Below is an example of a BOM builder in Axon;

Transferring quotes and copies of these quotes is easy and paperless, just email directly to a client.

Axon can also build a high level quote that contains general tasks time limit or requirement calculations and overall or individual costs. The quote can be then broken down by Axon into individual tasks and detailed production routes.

Even if you don't require a finite schedule, you can send the production requirement to the shop floor ready for manufacturing. The work-to-list in Axon will already have all the information for making the order.

Can I integrate Axon with other software systems?

Axon has flexibility in linking and integrating to other software systems, whether it be current systems your SMB uses – or external ones that you may use in the future.

What does it need to operate?

Axon only needs a Windows browser to operate, and our highly experience engineers will install and support you every step of the way.
